

## OpenMRS fact sheet

|                         |  |
|-------------------------|--|
| Application type        | Electronic medical records system  |
| Application license     | Open source, MPL 2.0 HD license  |
| Application technology  | Web application: Java  |
| Keywords                | Electronic medical records, electronic health records, electronic patient records, individual patient records, observations, diagnosis, tests, procedures, drugs   |
| Application description | <p>OpenMRS is an electronic medical records software which enables design of a customized medical records system without the need for software programming or to modify the database structure. The system is based on a conceptual database structure which is not dependent on the actual types of medical information required to be collected or on particular data collection forms and that can therefore be customized for different uses. At its core is a concept dictionary which stores all diagnosis, tests, procedures, drugs, which are then used to design custom data entry forms.</p> <p>OpenMRS has an API that enables interoperability with other applications, as well as possibility to plug-in additional modules tailored for specific implementations. Tools for data exporting and reporting are also available.</p> |
