

# Why addressing tuberculosis in prisons should be a public health priority

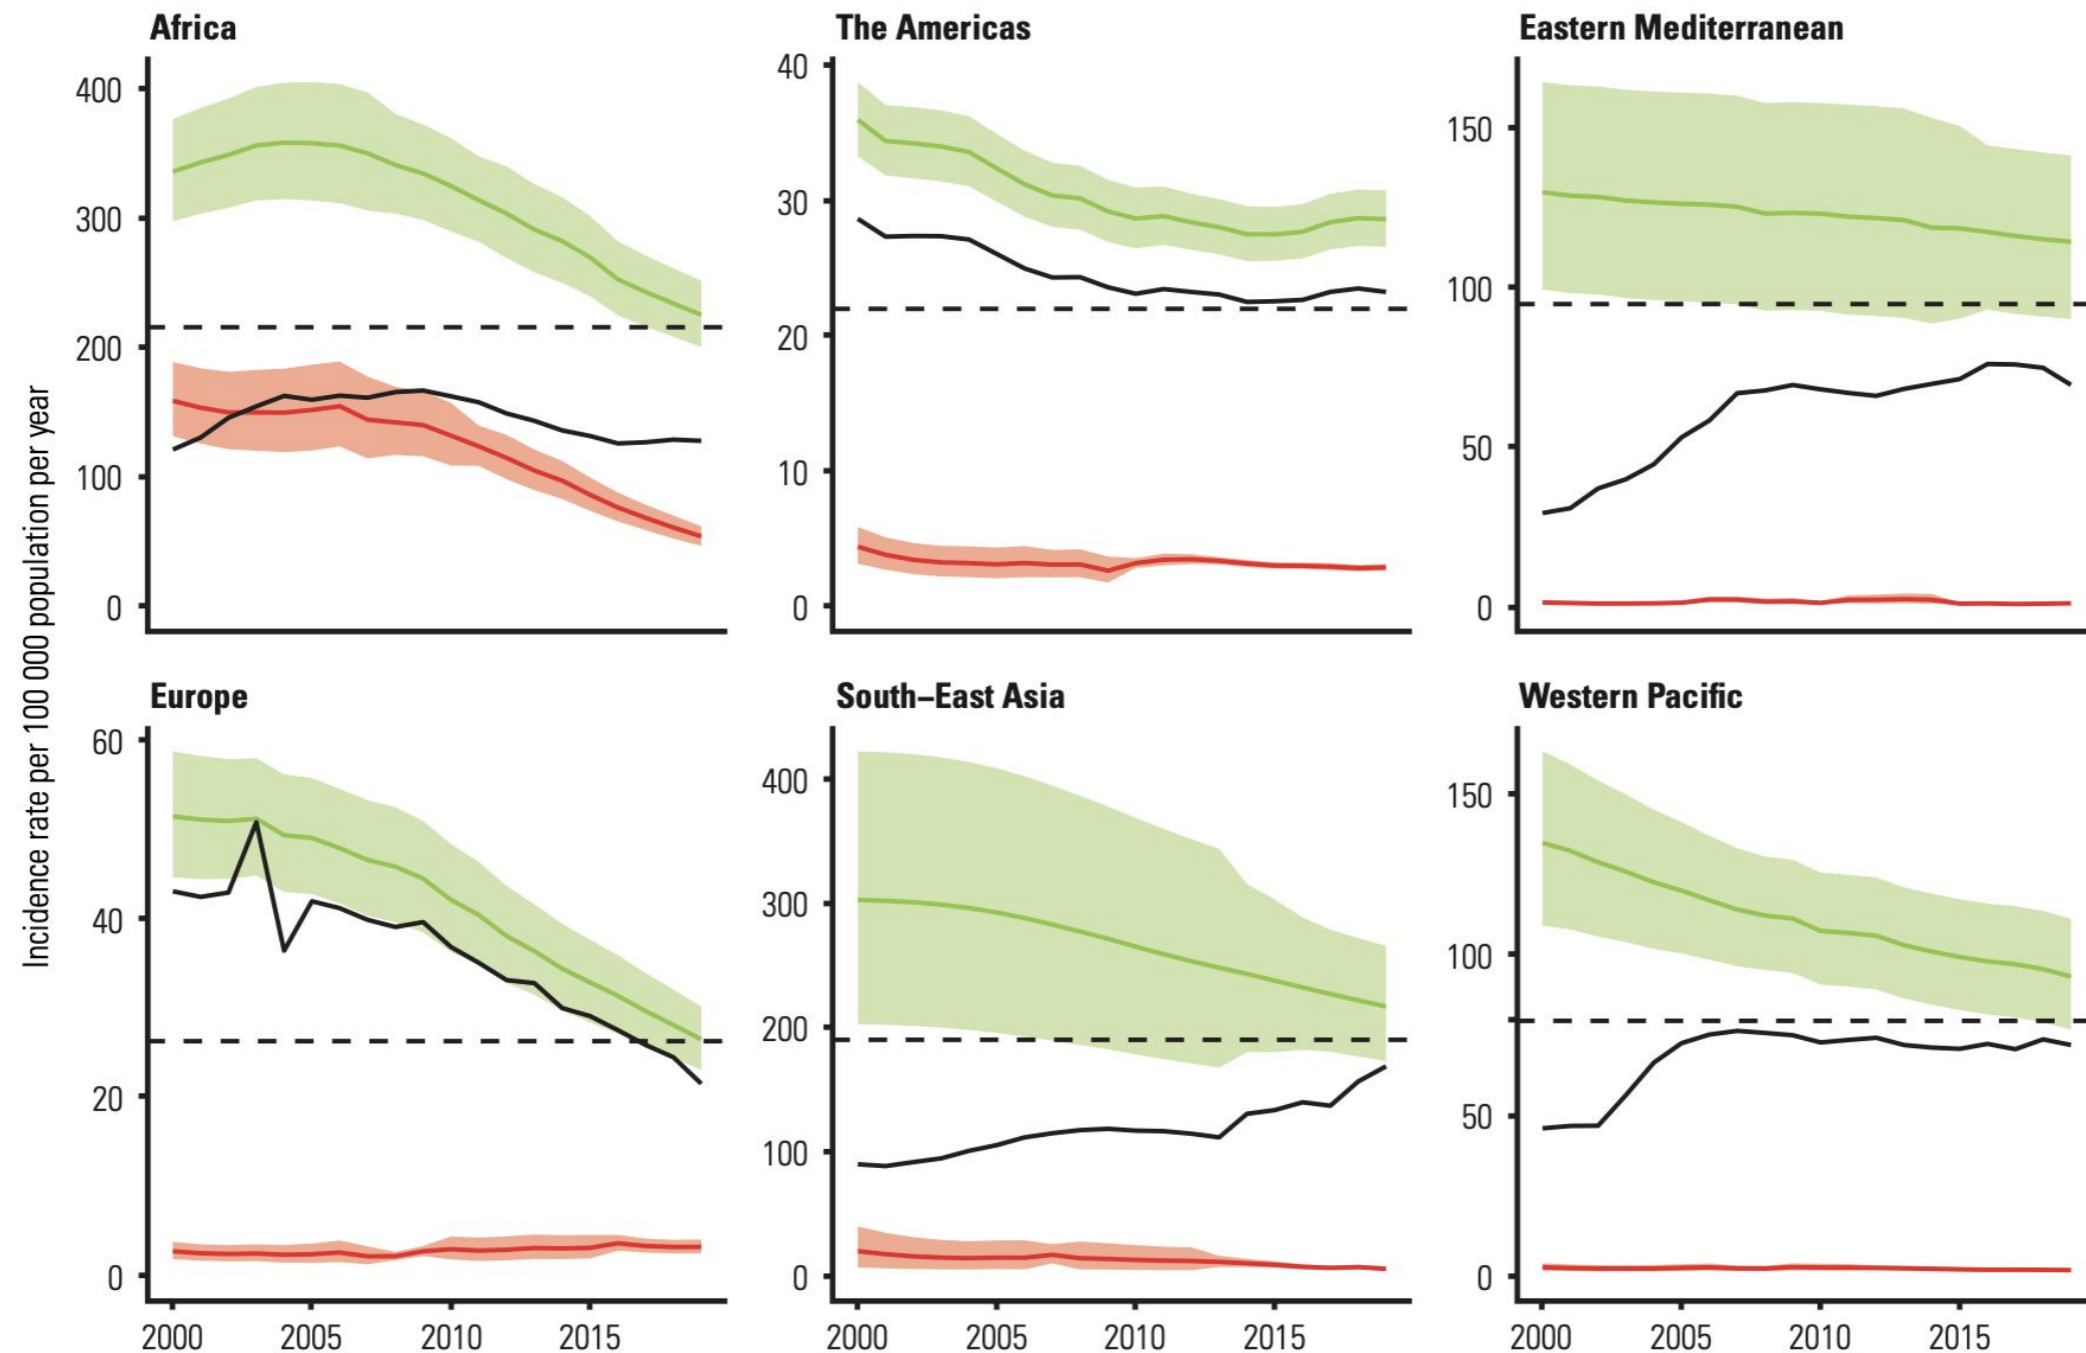

Swiss TPH Hybrid Symposium  
The Tuberculosis Pandemic– a Call to Action  
22 March 2023

Jason Andrews  
Division of Infectious Diseases and Geographic Medicine  
Stanford University

**FIG. 4.11**

**Trends in estimated TB incidence rates by WHO region, 2000–2019**

Total TB incidence rates are shown in green and incidence rates of HIV-positive TB are shown in red. The black solid lines show notifications of new and relapse cases for comparison with estimates of the total incidence rate. Shaded areas represent uncertainty intervals. The horizontal dashed line shows the 2020 milestone for incidence of the End TB Strategy.

# Excess tuberculosis cases and deaths following an economic recession in Brazil: an analysis of nationally representative disease registry data

# What role does TB in prisons have in TB in the community

# TB incidence duration and after incarceration

Prevalence of LTBI at first incarceration: <10%

During incarceration

After release

~50% of TB cases among people with incarceration are notified in community

# What is the relationship between prison and community TB epidemics?

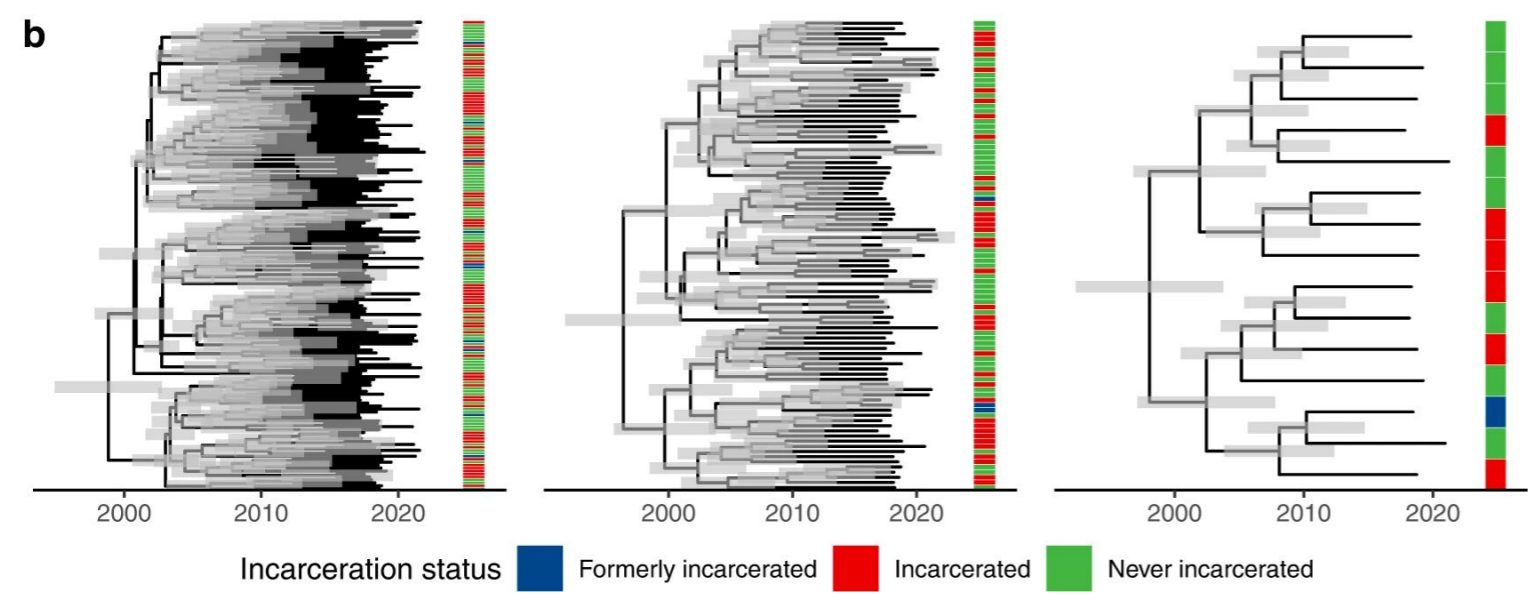

~40% of community TB cases arise directly from cases in incarcerated or formerly incarcerated individuals

Gygli et al. *Nat Med* 2021      31% of MDR TB in Georgia linked to prisons

Miyahara, *EID* 2023

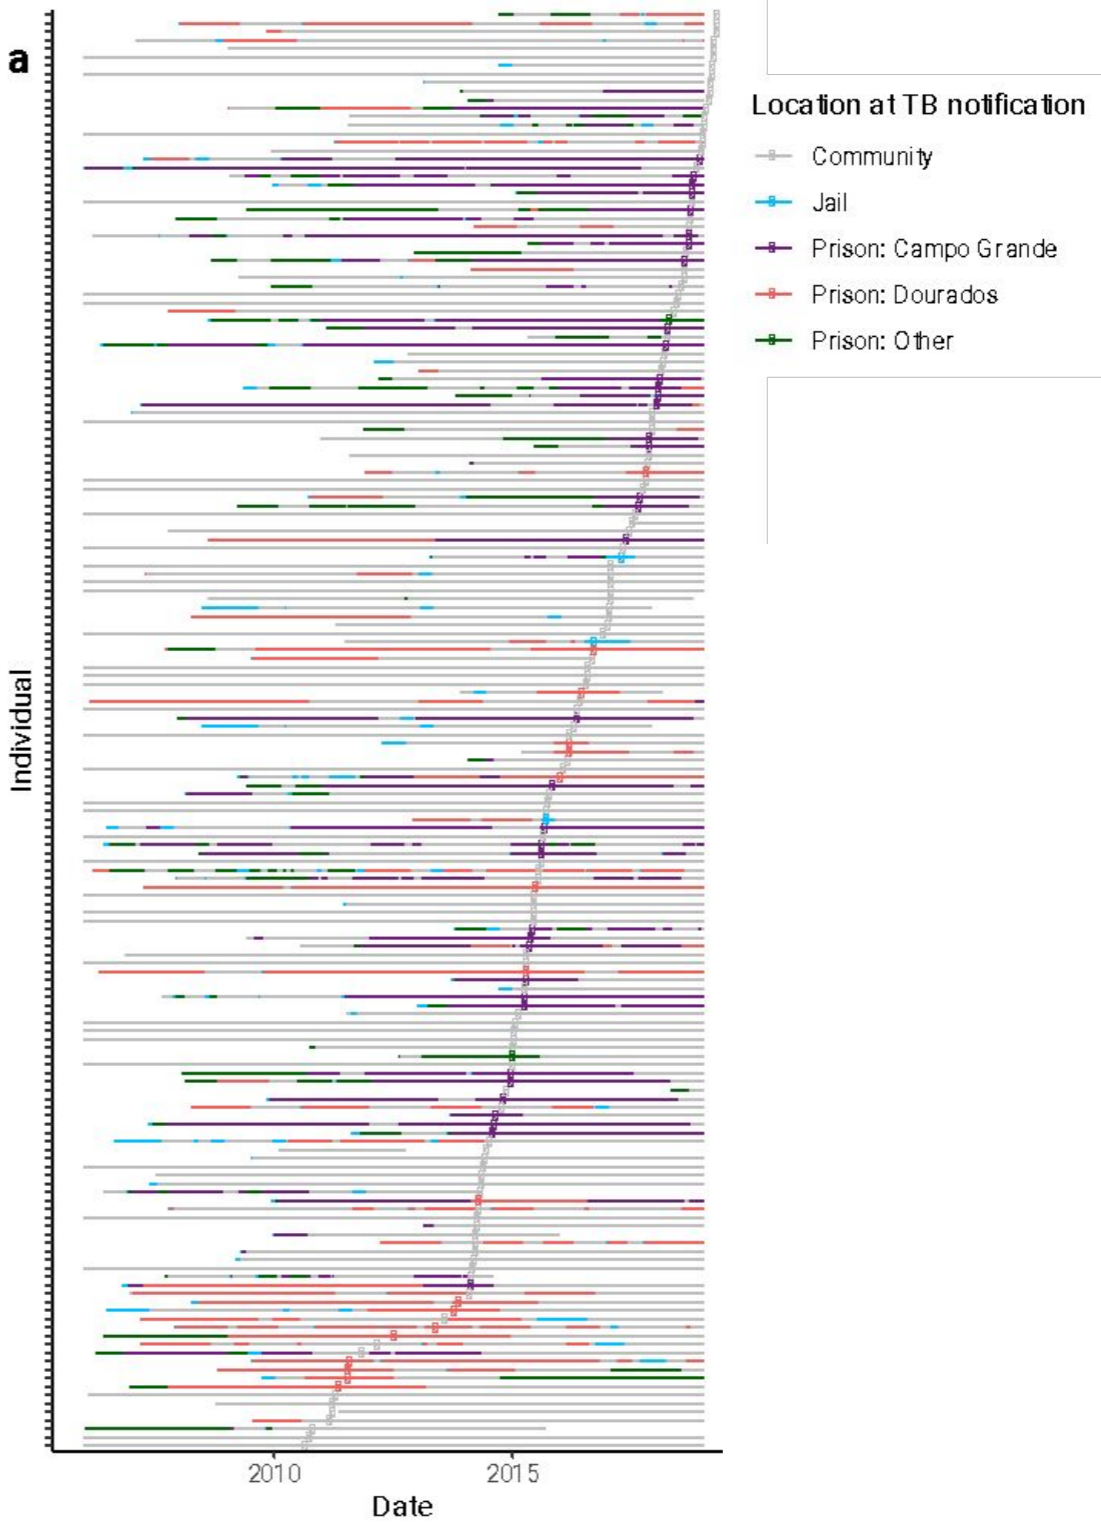

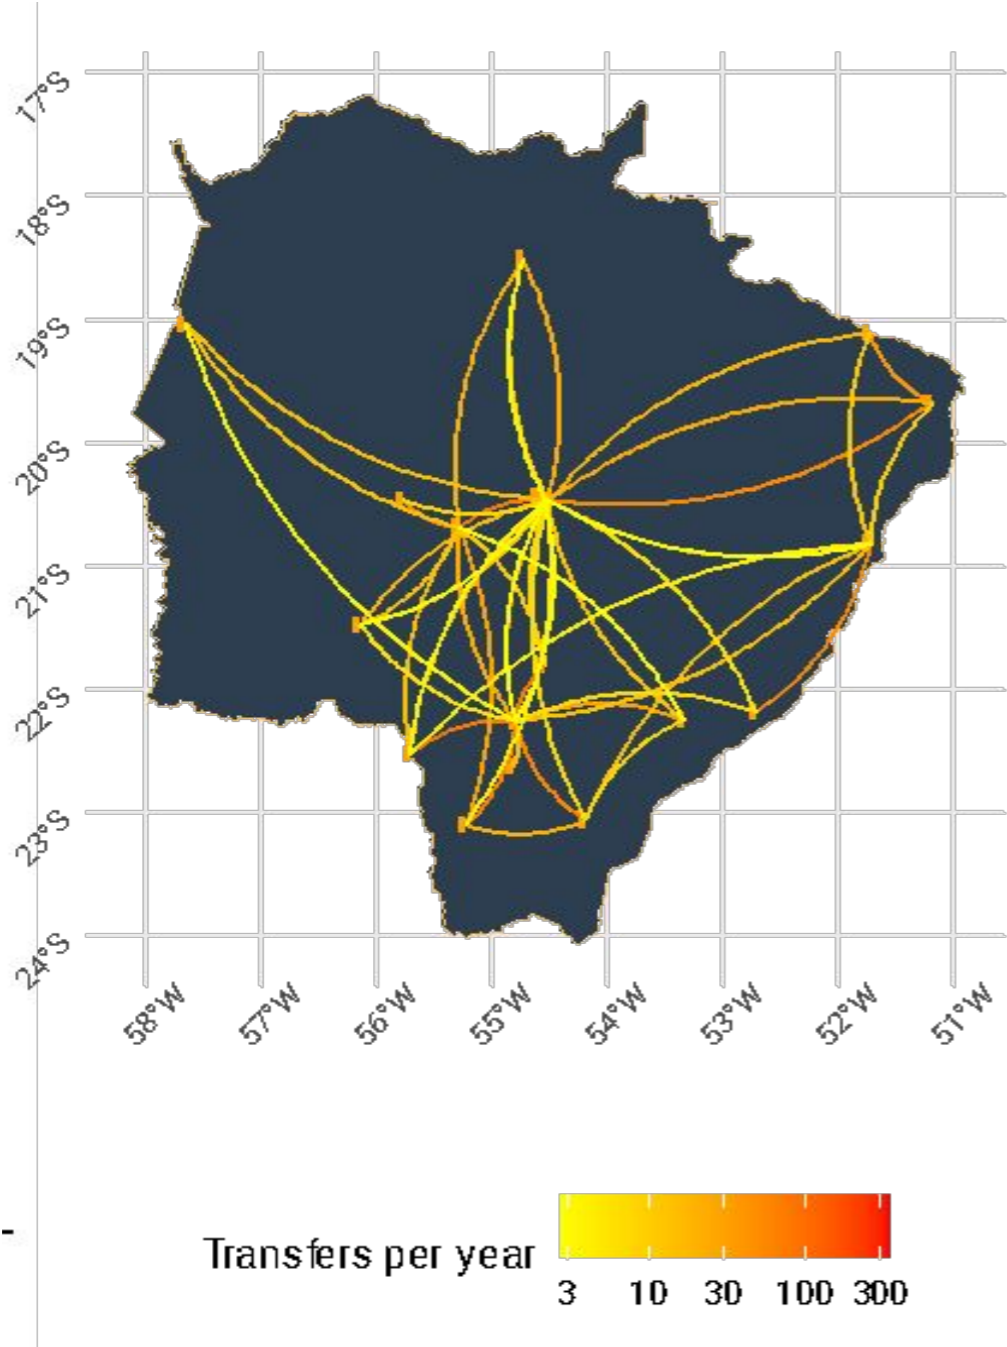

Formerly incarcerated individuals 4.7 times more likely to be in community transmission clusters (Thailand)

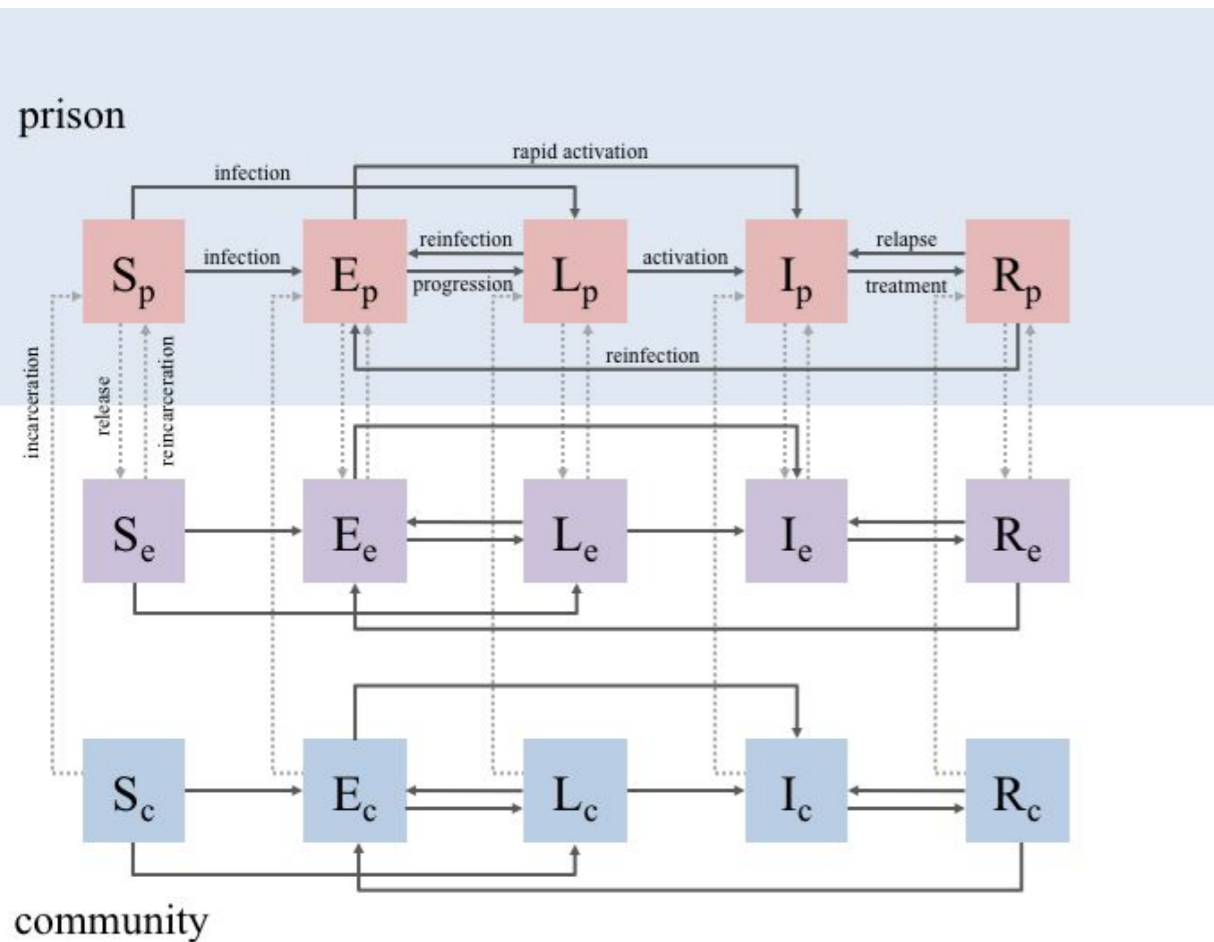

85% of never-incarcerated individuals in Paraguay were in transmission clusters with individuals with incarceration history

Sanabria et al, *Nat Comm*, 2023

# Prisons not only amplify but also spatially disseminate TB

# Interventions conducted in prisons could have outsized impact on TB

An effective combination of case detection interventions conducted only in prisons could reduce TB in the community by >30%

How can we respond effectively to the TB epidemic in prisons?

# TB Studies in Prisons in Mato Grosso do Sul

TB incidence in general population: 35 per 100,000

TB incidence prisons: >3,000 per 100,000

# Mass TB Screening

# Active case finding

For every participant,  
irrespective of symptoms:

- Chest x-ray
- Sputum collection for Xpert and culture

# Yield, Efficiency, and Costs of Mass Screening Algorithms for Tuberculosis in Brazilian Prisons

- 5,387 screened
  - 214 active TB (3.9%)
- Symptom screening would miss up to half of cases

# Screening markedly increased case detection

But prevalence remained extremely high

# Sputum pooling to improve testing efficiency

System	AUC (95% CI)	At pre-defined thresholds		At 90% sensitivity 4% prevalence		
		Sensitivity % (95% CI)	Specificity % (95% CI)	Specificity % (95% CI)	PPV %	NPV %
CAD4v6	0.88 (0.85–0.90)	80.7 (75.4–85.3)	82.7 (80.8–84.4)	62.3 (52.0–73.1)	9.0	99.3
LunitTB	0.91 (0.89–0.93)	79.9 (74.5–84.6)	89.8 (88.3–91.2)	83.7 (72.4–87.3)	18.7	99.5
qXR	0.90 (0.88–0.92)	74.5 (68.8–79.7)	89.4 (87.9–90.8)	74.2 (60.2–81.3)	12.7	99.4

**Table 2: Sensitivity, Specificity, Area Under the Curve (AUC), Positive Predictive Value (PPV) and Negative Predictive Value (NPV) of each algorithm at pre-defined thresholds or with thresholds adjusted to 90% sensitivity as specified by the WHO Target Product Profile minimum target.**

# Factors influencing specificity of CXR abnormalities

# Obstacles to implementing x-ray screening in prisons

- Many prisons lack x-ray machines
- Screening requires transportation of individuals outside of their cell block

We could use better diagnostics, but we have tools that work and shouldn't delay their implementation while this crisis continues

---

## Scaling up evidence-based approaches to tuberculosis screening in prisons

*Salome Charalambous, Kavindhran Velen, Zulma Rueda, Julio Croda, Michael E Herce, Sheela V Shenoj, Frederick L Altice, Monde Muyoyeta, Lily Telisinghe, Louis Grandjean, Salmaan Keshavjee, Jason R Andrews*

People deprived of liberty have among the highest rates of tuberculosis globally. The incidence of tuberculosis is ten times greater than the incidence of tuberculosis in the general population. In 2021, WHO updated its guidance to strongly recommend systematic screening for tuberculosis in prisons and penitentiary systems. Which case-finding strategies should be adopted, and how to effectively implement these strategies in these settings, will be crucial questions facing ministries of health and justice. In this Viewpoint, we review the evidence base for tuberculosis screening and diagnostic strategies in prisons, highlighting promising approaches and knowledge gaps. Drawing upon past experiences of implementing active case-finding and care programmes in settings with a high tuberculosis burden, we discuss challenges and opportunities for improving the tuberculosis diagnosis and treatment cascade in these settings. We argue that improved transparency in reporting of tuberculosis notifications and outcomes in prisons and renewed focus and resourcing from WHO and other stakeholders will be crucial for building the commitment and investments needed from countries to address the continued crisis of tuberculosis in prisons.
