

Swiss TPH Spring Symposium 2018

**Decision Support and Health Information Systems: Potential and Pitfalls**

# Context adapted Approaches to Data Collection and Knowledge Production

Helena Greter

***“Effective use of information is the foundation of modern public health practice”*** (CDC)

***“Quality of Life through Quality of Information”***  
(Medical Information Congress theme 2012)

***“Healthcare is about information”***  
(Concepts for a Personal Health Record)

This highlights the importance of **how the information is gained**, and how crucial it is to obtain **quality data**.

# Obtaining quality information

## 1. Data

- Availability: paper records, data base
- Access: to available data or to a population

## 2. Data collection

- Data quality
- Data security

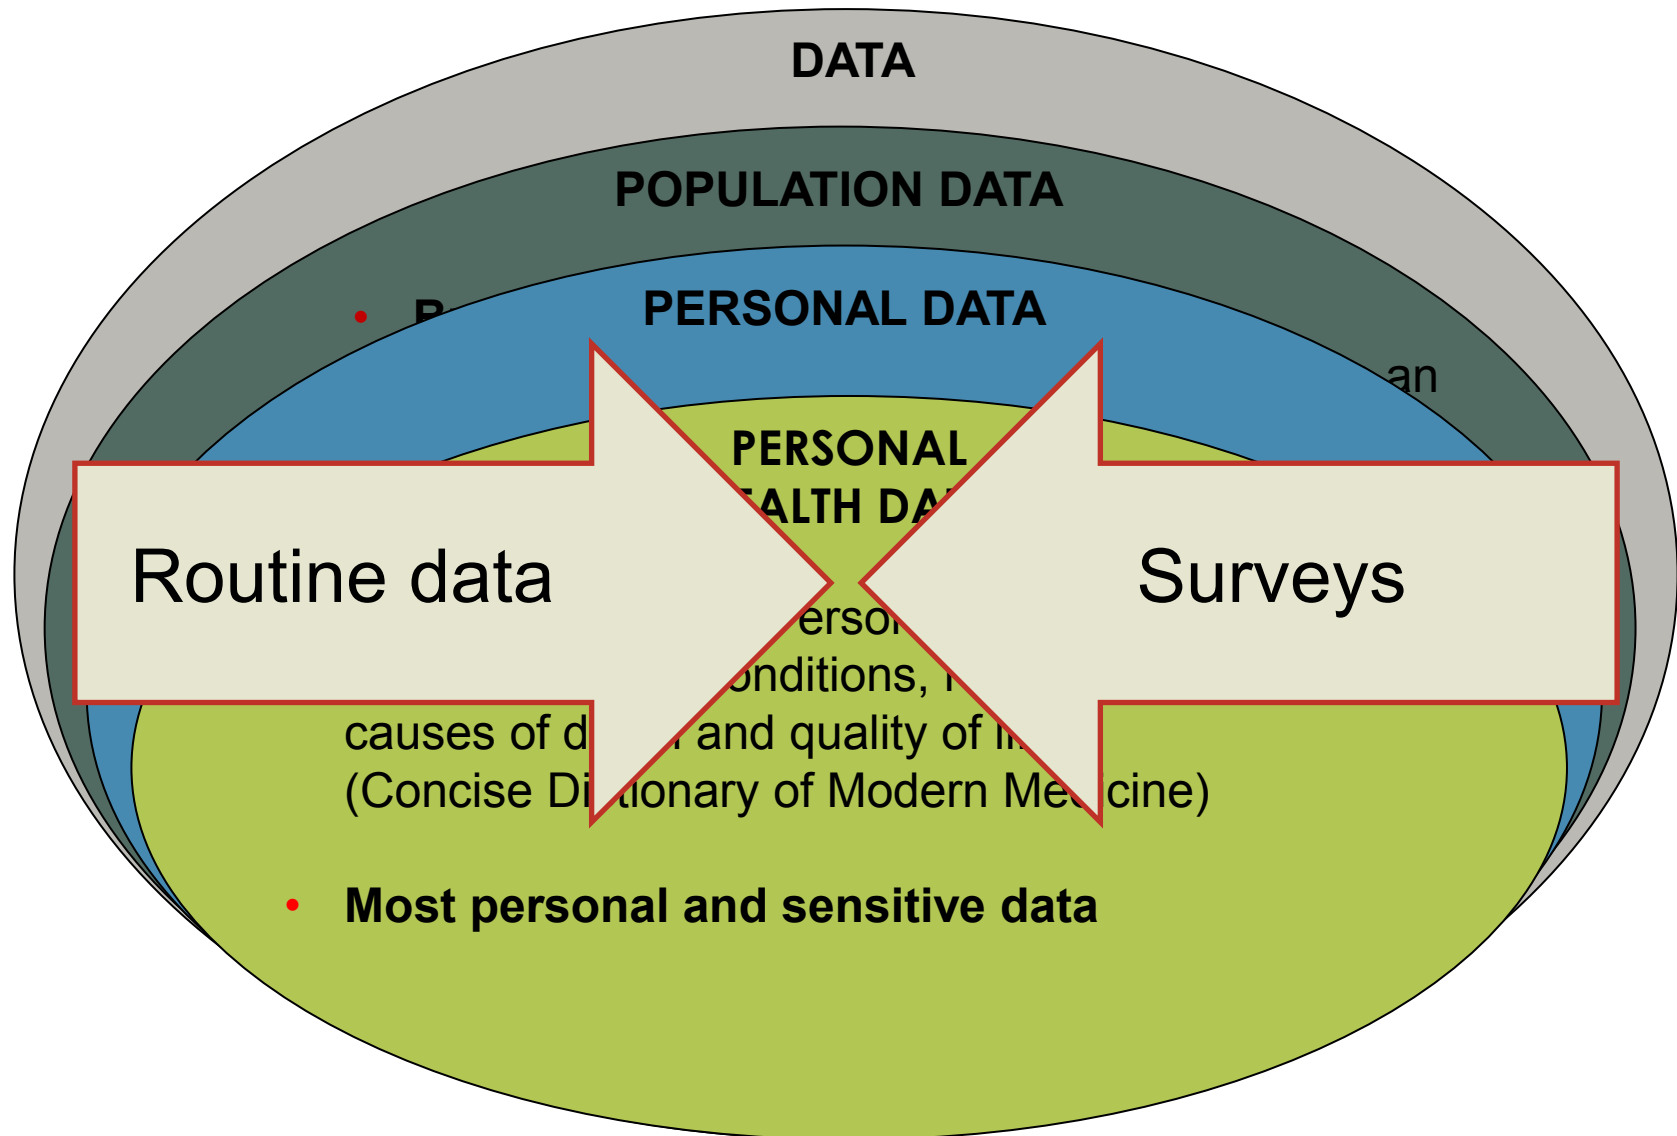

## 3. Knowledge production

- Analysis and interpretation
- Dissemination

# The concept of personal health data

## Routine data

### Availability is context dependent

Readily available at low cost

Useful for initial assessment or identifying hypotheses

Coverage:  
non-random sub-sample of a population

Not always up-to-date,  
Can be politically influenced and manipulated

## Surveys

### Provides up-to-date and targeted data

Representative  
of the study population  
through random sampling

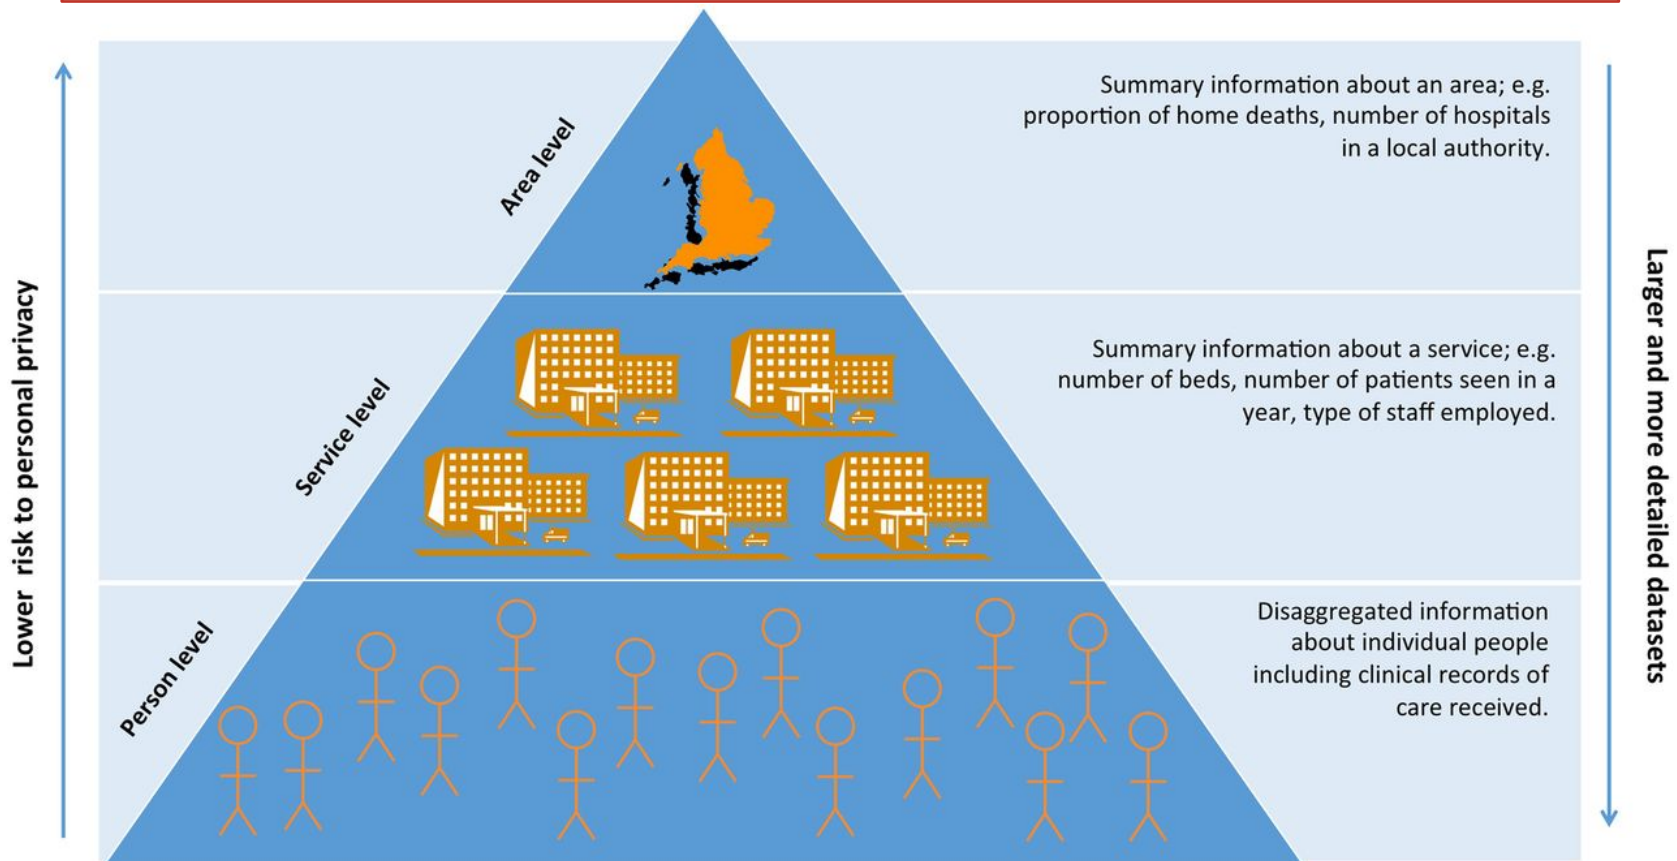

Point-in-time  
Up-to-date data

Targeted information on  
defined variables

Effort to collect data:  
time consuming and costly

# Routine Data Collection

Reliable and accurate public health information is essential for monitoring health and for evaluating and improving health-care services and programmes.

# Survey data collection tools

Types of data collection tools	
<b>Paper based</b>	<ul style="list-style-type: none"> <li>• Face-to-face interview</li> <li>• Telephone interview</li> <li>• Questionnaire by mail</li> </ul>
<b>Computers replace paper</b>	<ul style="list-style-type: none"> <li>• CATI</li> <li>• CAPI (ODK)</li> </ul>
<b>Computers replace interviewers</b>	<ul style="list-style-type: none"> <li>• Self-administered Questionnaires</li> <li>• CASI (online surveys)</li> </ul>

## Survey essentials:

- Rigorous questionnaire design and **pre-testing in the very context**
- Skilled and well-trained interviewers

# Data collection using CAPI: Advantages

## Interviewer

- Better guidance through the questionnaire

## Supervisor and survey coordinator

- Close surveillance of interviewer performance
- Real-time availability of data

## Interviewee

- Perception of CAPI is context dependend:
- increased confidence as data seems more secured

## Data collection using CAPI: Acceptability

# Data quality

## How does the survey tool influence data quality?

**PAPI** vs **CAPI**: Paper assisted vs tablet assisted personal interview:

- |                    |   |                           |
|--------------------|---|---------------------------|
| ✓ Less errors      | Paper: 17% (accuracy)                           | Tablet: 2% (completeness) |
| ✓ Reduced duration | Paper: 9.4 min                                  | Tablet: 8.3 min           |
| ✓ Lower costs      | Total survey costs 19% lower when using tablets |                           |

### **CASI on mobile devices:**

- not different results than on computers
- Yet...
- Lower response rate
  - Longer survey completion time

## Data security:

- Beyond anonymisation of health data, privacy, data ownership
- Security risks beyond institutional control

# Privacy-by-design approach

*Privacy by Design* is an approach to systems engineering which takes privacy into account throughout the whole engineering process. (Wikipedia)

**Privacy by Design is not about data protection  
but designing so data doesn't need protection**

# Conclusions

To provide a strong fundament for evidence based decision making, every level of the data collection process is of importance, taking into account the latest developments considering data quality and data security.
