

## Clinical Decision Support and Health Information Systems – Potential and Pitfalls of New Technologies

25 April, 2018, Verein Borromäum, Basel, Switzerland

New technologies are progressively transforming health care delivery. In health facilities, point-of-care devices can support clinical personnel in the diagnosis and care of patients. At system level, health information tools help aggregate and visualise data thereby facilitating decision-making for managers and policy makers.

The Spring Symposium 2018 invites health system professionals and students to share and review experiences of technology-enabled healthcare with a particular focus on low- and middle-income countries.

- Point-of-care solutions to improve diagnosis and care
- Data systems to support evidence-based decision-making
- Current digital trends and innovations
